ENGINEERING SERVICES

White Mountain Survey & Engineering, Inc. provides a wide variety of civil engineering services relating to most aspects of land use development. Below are some examples of the type of services we are able to provide. As with any list, this list is not intended to be all-inclusive, but it is intended to be representative of the types of services available from our office. If you do not find the service you desire, please feel free to contact us and inquire if we are able to provide the service you desire.

Drainage Analysis

White Mountain Survey & Engineering, Inc. has extensive experience in providing drainage analysis and design for both small and large projects. Our experience ranges from assessment of existing drainage problems for a single-family residence and proposing creative and cost effective solutions, to comprehensive grading and design for completely new commercial sites.

Our analysis and designs are used for obtaining local permits for Site Plan approval, for state permits for Site Specific approval, and for solutions to aggravating drainage problems that simply can't seem to be cured.

Road Design

White Mountain Survey & Engineering, Inc. routinely designs roads and driveways for private developers as well as municipalities. We have designed numerous roads throughout the state and country for private developers adhering to local, state and federal design standards. We pride ourselves in providing balanced designs that aid in minimizing construction costs; yet provide safe and convenient access.

We have had extensive experience in designing roads that are more pedestrian friendly, aesthetically pleasing and cost effective to construct. These types of designs require innovative thinking that balances the needs of the motor vehicle with that of the pedestrian.

Sewer Designs

White Mountain Survey & Engineering, Inc. designs sanitary sewers and municipal sewer connections in addition to on-site septic designs. These designs can range from a single sanitary sewer connection to a complete extension of a municipal sewer. These designs can also include sewer designs related to community septic systems for more rural projects, which would have the sewer run through the development, but the treatment would be via leach fields.

Small Community Water Systems

White Mountain Survey & Engineering, Inc. designs small public water systems as defined by New Hampshire Administrative Rules Env-Ws 378. A small community water system is any system that has 15 service connections or regularly serves more than 25 people on a year 'round basis.

Our experience includes the initial "Well Siting Criteria" report, right through design of the storage tanks and delivery system.
